Neoplastic Post-Transplant Lymphoproliferative Disorder

National Cancer Institute

Source

National Cancer Institute. *Neoplastic Post-Transplant Lymphoproliferative Disorder*. NCI Thesaurus. Code C7232.

A lymphoproliferative disorder arising as a result of post-transplant immunosuppression therapy. It is characterized by the presence of tissue destruction and effacement of the architecture of the involved tissues. There is clonal rearrangement of the immunoglobulin or the T-cell receptor genes. It includes the following variants: polymorphic, monomorphic, and classical Hodgkin lymphoma type post-transplant lymphoproliferative disorders.
