Potential competing interests: No potential competing interests to declare.

The article "Medical Physics and Cancer Treatment" offers a solid overview of the impact of medical physics on modern cancer therapies, particularly regarding imaging and radiotherapy advancements. However, it remains somewhat superficial, lacking in-depth exploration of specific technologies or case studies that could better illustrate the transformative potential of these innovations. While it successfully emphasizes the field's importance in enhancing treatment precision, a deeper engagement with technical details and clinical outcomes would have enriched the discussion and offered a more comprehensive understanding of the subject.
