Mesenchymal Chondrosarcoma

National Cancer Institute

Source

National Cancer Institute. *Mesenchymal Chondrosarcoma*. NCI Thesaurus. Code C3737.

A morphologic variant of chondrosarcoma arising from bone and soft tissue. It is characterized by the presence of malignant small round cells, biphasic growth pattern, and well differentiated hyaline cartilage. Clinical presentation includes pain and swelling. The clinical course is aggressive, with local recurrences and distant metastases.
