In the article, "Data Science using OpenAI: Testing Their New Capabilities Focused on Data Science," the authors have proposed an overview of the OpenAI capabilities analysis, and that is from the perspective of data science.

The authors make clear how important statistics is for health science research, planning, and decision-making. The article goes on to talk about how the research's validity and efficiency might be impacted by the mistakes made by researchers who aren't statisticians while using statistical methodologies. At the end of the study, the authors consider what went wrong, how it has affected scientific progress, and what may be done to fix it.
