

Review of: "From Complex to Real Numbers: A Reverse Detour for Solving Polynomial Equations Using Complex Numbers"

Khatere Ghorbani-Moghadam

Potential competing interests: No potential competing interests to declare.

Generally, the contribution of the work is quite weak. I have a few comments for this paper:

1. The abstract needs to be rewritten; it does not showcase the innovation of the paper.
2. Authors should review and correct the punctuation in nearly all mathematical equations. A mathematical formula usually ends with a comma or period.
3. The keywords are not appropriately chosen.
4. There are many mistakes in the structure of the paper (for example, the numbering and referencing of the formulas in the text of the article are not correct).

I believe the author needs to work on these issues further.
