It is an interesting paper that addresses a common problem in education. Not by chance, the rapid rise of Generative Artificial Intelligence has increased the problem of cheating in all educational levels around the world.

The paper addresses this specific problem in Poland, arguing that cheating in education is something particularly worrying in the Polish tradition. This is backed up by some statistical data that should be updated to check its validity. But even if the claim is true, it would also be nice if the paper compared the average of similar cultures on this issue.

. In any case, my main concern with the paper is with section B "B. Ethical awareness and legal orders" and its link with the solutions to the problem, which are generally acceptable but should place much more emphasis on the educational side of the problem. At the end of the day, there is nothing better to overcome this problem than to be aware of the negative side effects that cheating has on society as a whole. That's why I encourage the author to do more research on the viability of the proposed code of ethics for education and expand the proposed solutions going deep in positive rewards to increase self-responsibility.
