Potential competing interests: No potential competing interests to declare.

This review has been carried out to find the clinical implications of Epithelial-mesenchymal transition (EMT) in Head and neck squamous cell carcinoma (HNSCC) and discusses many pathways which are quite insightful.

However, there are some problems in the structure of the article.

First, I would suggest putting numbering for all the headings and sub-headings because it will show the connectivity of the relevant materials.

Second, the Conclusion part is very long. It should be shorter, and any references should not be presented here. Apart from the first paragraph of the conclusion, all the content should be presented in the discussion part of the article. The conclusion is the authors' opinion about the topic and the findings they have collected after reading so many articles.

Third, the authors should include some more references to justify the depth of the study.
