Potential competing interests: No potential competing interests to declare.

The paper presents an interesting idea of applying machine learning techniques to predict unemployment rates in developing countries.

There is a good initial exploration of the problem, listing different machine learning techniques that could be applied and reviewing indicators that could be used as input data.

But beyond the outline of the idea, the paper does not provide much more. To be a complete research paper, two important elements are missing: the creation of a dataset from the identified indicators, and the performance of an experimental analysis to validate the hypotheses put forward.

In short, an interesting idea that has not been put into practice.
