It appears that ChatGPT was used by the author to write this article. The author conducted some chat on ChatGPT and posted the replies as they are, in the form of a paper, as can be seen in the **Introduction** point "*In this response, I will...*" and the **Uses** point "*As an AI language model, my role...*". It is nowhere a noble thought and a clear violation of research ethics.

Although, the use of an AI language models to help generate content is not uncommon among writers, but it should be disclosed clearly in the article. Additionally, when we utilise an AI model to create content, the original source of the information is never disclosed, making it difficult to give credit where it deserves. Nonetheless, it is still crucial to be transparent about the use of AI models and to take steps to ensure that any content generated is properly attributed and cited.
