Review of: "A Harmless Avian Vaccine Virus Could Be Developed into an Off-the-Shelf “Antibiotic” for Viruses"

Iole Farina¹

1. Istituto Superiore di Sanità, Rome, Italy

The article proposes the use of a non-pathogenic virus that can control different viral infections. Although this is a promising and innovative strategy, there are key steps missing from this work. It lacks details that IBDV induces INFB and INFg but not IFNg, which could give insight into the modulation of the immune response. In addition, there is a lack of data on the study of different immune cell populations. Finally, more information regarding the production and storage of IBDV would be needed to understand the applicability of this therapy.
