The manuscript is very interesting. However, this paper requires considerable further improvement with the following comments:

1) Land use in Figure 1 needs to have a source to prove reliability. I think that land use maps were extracted using remote sensing. So, the paper has to mention clearly this data.

2) The flowchart of the methodology used for Figure 2 is not good or clear.

3) DEM data is missing spatial resolution.

4) The Study Area section can change to Study Area and Data. Besides, the manuscript can show the location of the study area on a map.

5) Table 1 can move to the Study Area and Data section.

6) The decimal units must be a comma, not a point.
