Interesting topic but there are several issues that I believe needs to be addressed.

- There are grammatical errors that need to be fixed.
- The statistical analysis presented in the abstract is not clear what was statistically significant.
- In the materials and methods, there needs to be a better explanation of how the data was analyzed. I don't completely understand it. Are you comparing academic staff response to students response?
- Actually, I would also double check with a statistician to make sure that you are using the right data analysis to compare your data.
- You can expand on study limitations. For example, there should be an age difference between students and academic staff. Students who are younger, likely had earlier/better exposure to things done virtually.
