Potential competing interests: No potential competing interests to declare.

In this review, Dr. Rosso highlights the history, customs, religious rituals, etc., of two plants used in different ancestral and indigenous cultures. These plants are peyote (in Nahuatl, peyotl), mescaline, and mandragora (*Mandragora officinarum* or *Atropa mandragora*). Reference 3 is not specified; it is where he supports the concept that he is a shaman. Maybe I can include it. Also, include some reference that supports the idea that today shamans study more about psychological or neurological medicine and that doctors come to learn more from healers and shamans. Well, this would represent an advance in transversalism between empirical and scientific science and a very interesting and purposeful degree of inclusion.
