**Potential competing interests:** No potential competing interests to declare.

The manuscript by Labrou and Pehlivan describes the use of flavocillin as a potential inhibitor against TrxR and OATP. The manuscript has some merits for the publication but it needs a major revision. 1) the title includes "OATP" but this is not mentioned in the text. 2) The main point is that it thoroughly lacks the consistency to follow. 3) The method is poorly described and the docking software is missing and therefore 4) the numbers considered as "good binding efficiency" lost their meanings. 5) The same sentences are poorly written and hard to understand.
