Very good effort by the author. Following are my few suggestions for the paper:

1. Pandemic may have aggravated the speed of automation but the trend emerged and was being discussed even before the pandemic. So, in the title of the paper, post-Pandemic may be substituted by the 4th Industrial Revolution.
2. The title of the second section of the paper, "Technological Unemployment: is the World Moving towards a "Workless" Society?", and the discussion in the section do not match with each other. In the discussion, there are different estimates of job loss.
3. When you say that the speed of automation is slow in Nigeria than in developed countries, it would be better if you give a basis of also of saying so.
4. The issue of skill mismatch is the real strength of the paper as the issue may not be only in Nigeria but in many other parts of globe. However, the analysis needs a more detailed and in-depth discussion.
