Magrath Regimen

National Cancer Institute

Source

National Cancer Institute. *Magrath Regimen*. NCI Thesaurus. Code C63780.

A regimen consisting of cyclophosphamide, vincristine, doxorubicin, prednisone, and high-dose methotrexate used to treat aggressive forms of non-Hodgkin lymphoma; also used as primary treatment of AIDS-related and high-risk Burkitt's lymphoma. Intrathecal cytarabine and methotrexate are included in this regimen as either prophylaxis or treatment for central nervous system (CNS) involvement.
