

# Review of: "Multi-target effects of flavonoids as PPARG agonists in TCGA cancers"

Potential competing interests: No potential competing interests to declare.

This paper suggests that PPARG agonists may have cancer therapeutic effects. It is significant to study the multi target of flavonoids as PPARG agonists in TCCA canver. However, There are several place in the article that need to be modified and improved, such as properly compressing the introduction; The title is flavonoids, and the main work is flavonoids extracted from yellow tea, which is not consistent with the title; Why choose yellow tea as the research object? Explain the significance of selecting parameters in molecular docking; It is suggested that flavonoids in yellow tea be supplemented as PPARG agonists; Less than half of the literature in the past three years in the reference, delete the old literature and add new literature. Due to many modifications. It is recommended to return the manuscript.
