

# Review of: "One-Person:Unicorn: Harnessing GPT-Based Expertise for Advancing Professional Growth in Business"

Daniel Samaan

Potential competing interests: No potential competing interests to declare.

The article discusses how large language models (LLM) like GPT-4 can be utilized to advance professional development and business development. A good overview of the recent literature is presented. It provides convincing examples of how a person's technical skills could advance in a self-learning environment with the help of GPT-4. The article could be clearer about how exactly soft skills and interpersonal skills would improve by simply interacting with a machine. One could question to what extent interpersonal skills or emotional intelligence of a person can meaningfully improve without predominantly interacting with other (real) people. The article also remains a bit vague about which business sectors and which types of workers (e.g. blue collar versus white collar workers) could mostly benefit, or would not benefit, from the capabilities of GPT-4.
