The article present the market evolution of higher market cap cryptocurrency during COVID-19 period. The author address two main objective at the beginning of the paper: 1) to focused on regulatory mechanism; 2) To know the risk-return of selected crypto currencies. In my view, the author only covered very partially the second objective but nothing is mentioned about the first one. It is not clear at all how regulatory mechanism has impacted on the cryptocurrency market. The content of the paper corresponds only with a data descriptive section of any other paper on the subject but I miss a more detail explanation about the motivation, hypothesis raised and methodology. Are the author's conclusions corroborated in other published investigations?. In short, it seems to me a very incomplete article where the intangibility of cryptocurrencies has not been demonstrated although I would first like to know what the author means by intangibility applied to cryptocurrency markets.
