Author included Durbin Watson on the statistical result table (coefficient), however no explanation regarding the autocorrelation test. The Durbin Watson value of 0.9 indicates that the research model contain autocorrelation issue. It will be better that author run the casewise diagnostic function in order to indicates some data which need to be outliered. After that rerun the regression analysis, in order to get better result of Durbin Watson value. Another issue is that this paper only have five references which is not appropriate. Add more reference from similar topics published papers in order to strenghten the hypothesis development
