Multiple paragangliomas associated with polycythemia

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Multiple paragangliomas associated with polycythemia. ORPHA:324299*

A rare, endocrine disease characterized by early onset of polycythemia, and later occurring multiple paragangliomas. Clinical presentation includes hypertension, headaches, fatigue, nausea, anxiety, and high concentration of red blood cells, leading to increased risk of stroke and pulmonary thrombembolism.
