Dear Author,

Here are the general insights and comments that I have on the paper

Overall positives:

- The paper addresses a crucial issue: **reducing non-revenue water** for efficient water resource utilization. This is a **highly relevant and valuable topic** in the field of water management.
- The **abstract section is well-written**, which is a strong first impression for any scientific paper.

But here are the points to be addressed for improving the quality and impact of the paper.

Areas for improvement:

- **Missing citations:** Citing relevant sources is **essential for scientific rigor**. It strengthens your arguments by demonstrating your research and understanding of the field. Simply listing references at the end is insufficient. You need to properly integrate citations within the text to indicate which ideas originate from other sources.
- **Low-quality illustrations:** **Clear and informative figures** are crucial for scientific communication. Poor-quality illustrations can hinder understanding and reduce the impact of your findings. Consider improving the resolution, clarity, and labeling of your figures.
- **Grammar and spelling errors:** **Professional communication is essential** in scientific writing. Grammatical and spelling errors can detract from the credibility and impact of your work. Carefully proofread your paper to ensure it is free of such errors.

Recommendations:

- **Conduct a thorough literature review** and **integrate relevant citations** throughout the paper. This will strengthen your arguments and demonstrate your expertise.
- **Revise and improve the quality of your figures.** Ensure they are clear, well-labeled, and appropriate for the scientific audience.
- **Proofread your paper carefully** to correct any grammatical or spelling errors. This will enhance the readability and professionalism of your work.
