<http://12/09/24> Hello Sir/Madame, I am writing this review report for the article 'Covid-19 Crisis: Exploring Challenges, Opportunities, and Cautions' written by K. K. J. Chakravarthy, Potula Sree Brahmanandam, D. M. Potukuchi, G. Uma, J. V. Krishna Kumar, T. Karthik Sai Ram, J. V. Srinivasu, Dileep Kumar Kadali, M. Rajesh Yadav, L. Satish. The topic of the article is quite interesting and important in this era. This is because Covid-19 has a huge impact on the world in every sense. However, this article seems to lack the history/background of the Covid-19 emergence and effects on the different countries in a comparative way. Moreover, the references are not well-structured and are missing. It needed to focus on more references in relation to the topic. When it comes to the measuring/method, it is not clear enough, and the hypothesis is not clarified. As it is shown that, this article concentrated on Covid-19 challenges, opportunities, and cautions, but there are no methods seen to test the hypothesis. What kind of measurement was used and tested? The Conclusion part is not explained effectively; in other words, what had been found in this article? Also, the conclusion part needs to be combined with your results, literature, and further suggestions. In my view, what is the real effect or result of this article is not provided efficiently. I believe that when these suggestions are performed, the article would be more interesting and effective as a research paper. Kind Regards
