

Review of: "Impact of risk factor diabetes mellitus on patients with periodontitis"

Saif Khan

Potential competing interests: The author(s) declared that no potential competing interests exist.

The authors have given a cursory view of the relationship of periodontal disease and diabetes mellitus. The manuscript needs more evidence to prove the relationship. As periodontal disease is now considered sixth sign of diabetes mellitus and both share a two way relationship, thus to explain this relationship biochemical and immunological underpinnings and process should be discussed. The authors may put a flow chart to make the relationship more understandable. References should include recent systematic reviews/clinical trials exploring the relationship between periodontal disease and diabetes mellitus.
