Congratulations on the work done by the team, the paper is good, but some corrections are necessary

## Material and Method

### Chemicals and applied medicine

``Application doses were 100 nmol DMBA and 10 nmol TPA dissolved in 200 µl acetone`` - Why are they using these doses? Put some reference or explain how arrived at these percentages

### Application of the carcinogenesis model

- Was the toxicity study and the carcinogenicity study carried out? If so, put it in a more explanatory form
- What are the treatment groups? what doses does each group receive and how many animals are in each group? Please put in your text
- Which reference was used in the experimental design? put a reference

## Results

- Please rearrange your results text, it's confusing. A suggestion, put a structure as in the material and methods, first with the result of toxicity, then carcinogenesis and finally the results of the histological studies
