The article represents a very significant aspect of sustainable future that is environment sustainability along with economic growth. The article presents the analysis of the efforts made by two developing nations Sweden and India towards environment protection and sustainable business. This is a very theoretical analysis of the environment challenges faced by the two countries and the policies that have been developed to protect environment because of climate change and its impacts.

The authors seemed skewed towards Sweden as the amount of efforts India is making for environment sustainability is really commendable. The analysis is not supported by any data or reports. There are different aspects of environment sustainability and a comparative study can be conducted with the data analysis regarding the policy framed and implemented and its impact on the environment.

For example, India introduced business responsibility and sustainability reporting (BRSR) in 2021 covering different aspects of sustainable business operations. Sustainability reporting maturity model developed by Institute of Chartered Accountant of India (ICAI) gives a scoring scale to understand how the companies are reporting on different aspects of sustainability including environment reporting.

A comparison of actual performance on sustainability of environment would add more credit to this article. In the current form it is just a presentation of some of the policies introduced by two countries under study for sustainable environment.

Best Wishes
