Dear Authors

I’ve read your report. It is very well-written paper and well designed. Abdominal area is commonly used donor site for head-neck reconstruction. VRAM or TRAM flap and DIEP flap are well known among plastic and reconstructive surgeons. They have good caliber vessel dimensions and let microsurgeon do easy anastomosis. Head-neck region is a good anatomical area for vascular anastomosis. More than one vessel can be found as recipient vessel.

One critical question for authors: you have higher flap loss rate. What is your opinion about that?
