Potential competing interests: No potential competing interests to declare.

Congratulations to the authors for the idea of the article. Finding and implementing methods to provide energy in rural areas is necessary for many areas of the world.

The article requires major improvements, primarily related to the classic structure of any article.

The abstract must briefly present the objectives and results of the article. Project manager details must be removed.

An introduction must be added in which the importance of the chosen topic is presented, starting from the general to the particular, but also the clearly formulated objectives of the study. The introduction part must also present the current state of the specialized literature and what are the novelties brought by the present study. In addition, the study area and its characteristics must be presented.

In the methodology, the data used must be concisely described: how many questionnaires/interviews were conducted? to whom were they addressed? on the basis of which criteria was the sample selected?

The authors mention: "Site inspections were conducted to identify the optimal location for the system's installation, considering factors such as accessibility, slope, and water flow rate". What does accessibility mean? what types of roads were included in the analysis? It would be useful to insert a table with all the details of the criteria included in the analysis. The results could be accompanied by a spatial representation. The amounts from the ROI analysis can be converted into euros/dollars. In this chapter, the social/economic/environmental implications must be discussed separately.

A chapter of conclusions is necessary in which the objectives are correlated with the results.
