Potential competing interests: No potential competing interests to declare.

The Co-Authors retrospectively report the outcome of humanitarian missions in an African country, dealing with surgical treatments of cleft lip (CL) with or without cleft palate (CP) malformations. While established treatment modalities have been used (thus not reporting any new technologies), this draft would seem worth following, no doubt. Some few minor shortcomings (for example, please separate numbers and units, and provide full information on materials and methodologies having been used) should be improved. Moreover, with your Conclusions, please stick exclusively to your aims, and provide a reasonable and generalizable extension of your outcome.
