Potential competing interests: No potential competing interests to declare.

The research paper titled “Analyzing the Effects of Organic Amendments on Soil Erosion Dynamics: A Comprehensive Study on Application Methods and Timing” explains the utilization of organic amendments in understanding soil erosion dynamics. The results part is not written effectively, as the results are just presented in a repetitive manner through many sections. In section 3.1, the results are just directed to table no., whereas they should be explained in terms of any change in trend or presence of any outlier data. Similarly, many sections are created which seem to be for only increasing the number of words in the draft. Results and discussion could be merged along with the sections namely “Comparative Analysis with Reference Review.” This is creating unnecessary confusion and stretching the manuscript meaninglessly.

Captions of tables should be rephrased; where in table 1 it is written as some characteristics of soil, write it directly as physico-chemical characteristics of soil and organic amendments.

Overall, the quality of the written content is average, although the data given is sufficient to provide explanations. The paper lacks scientific explanation and is stretched too much by introducing too many sections. The manuscript should be detailed yet crisp in terms of explaining reasons for the data observed. A thorough revision is suggested, with the addition of more references and a re-written results and discussion section.
