Potential competing interests: No potential competing interests to declare.

The article explores a fascinating topic, but there are certain flaws in its current form that should be addressed for overall improvement.

First and foremost, a more robust methodology for search and analysis would enhance the credibility of the study and yield more reliable results. The article lacks clarity regarding key aspects of the research process. Specifically, it is unclear how the research was conducted, whether any inclusion/exclusion criteria were applied, which database(s) were utilized, and the specific research strings employed. Providing these details would strengthen the study's methodology and transparency.

Furthermore, to gain a deeper understanding of the role of smartphones and the subsequent sharing of content on social media platforms, it would be beneficial to broaden the scope of analysis. By examining cases where smartphones were not involved or where content was not shared, researchers could identify potential differences and nuances in the dynamics of violence and content dissemination. This expanded analysis would provide a more comprehensive view of the subject matter, offering insights beyond the immediate focus on smartphone-related incidents.

In summary, while the article delves into an intriguing subject, it would greatly benefit from addressing the aforementioned issues. A more robust methodology with clear documentation of research processes and a broader analysis approach would enhance the article's overall quality and contribute to a more comprehensive understanding of the complex relationship between smartphones and the sharing of violent content.
