"The linear version presented is generally well-written, but some points need improvement. Especially in sections that specifically discuss cell lines in laboratory conditions, it would be beneficial to elaborate on the limitations and conditions of these experiments.

The author has discussed the emergence of various Omicron variants and their impact, but there is a need for more evidence and research to support these claims.

Additionally, the author refers to the impact of different variants on various aspects of life, but based on the presented claims, sufficient details to support these statements have not been provided.

In the section on the mechanism of nebulized nano particles in the lungs and the advantages of intravenous injection, the author should provide more information to clarify the differences.

Finally, some grammatical and sentence structure revisions, along with necessary updates, are recommended for improving the overall quality of the article. It is advisable to have a professional editor review the article before publication."
