Review of: "Antibacterial Activity of Malaysian Trigona itama and Trigona thoracica Honey Against Gram-Negative and Gram-Positive Bacteria"

Fatimah Hashim¹

1. Faculty Of Science and Marine Environment, Universiti Malaysia Terengganu, Malaysia

The work conducted is good. However, the research findings are not very comprehensive in terms of literature writing, results, and discussion. The results are somewhat concise, while the discussion is very minimal. Please also relate the contents of the various types of honey and how their effects on different types of bacteria vary. Expand further on the explanation regarding the different types of honey, the types of actions against bacteria, and the different methods used.

For each subtopic, please include a discussion comparing the differences in honey and their effects on bacteria, highlighting the variations observed during testing.
