Potential competing interests: No potential competing interests to declare.

The paper presents a practical solution to aid visually impaired individuals. It is well organized, discusses the relevancy of the problem being solved, and explains the methodology in an elaborate fashion. Few areas where the paper can be improved further are below.

1. Provide evidence to support why certain sensors were used. For example, it is mentioned that the obstacle detection range is calibrated between 20cm to 2 meters, back this up with reason why this range is suitable for the problem being solved.
2. Provide comparison of the results of the current approach with other related works.
