In the Method section, I would like to know some additional information, such as:

Was the study conducted retrospectively or prospectively?

What are the inclusion and exclusion criteria for participants?

Where were the participants recruited? What were the ages? Were they of both sexes?

What was statistical analysis used?

In the Results section

In table 1, the header has **n**, but does not say the total value. The first variable "Parenteral Ages" is in mean and standard deviation, while the others are in number of participants and percentage. I think it should be standardized or tabled differently.

In the description of the results in table 3, they calculated the OR even for those variables in which the p-value was not significant.

In **table 3. Sociodemographic factor and verbal abuse behavior**, the percentage values are incorrect. The sum of the percentages of the columns is greater than the total described.

Example

Variable	verbal abuse				Total		OR	P
	no		yes		n	%	(95% CI)	
	n	%	n	%				
Father education level								0.184
Elementary school	20	83.3	4	16.7	24	100		
Junior high school	18	100	0	0.0	18	100		
Senior high school	99	82.5	21	17.5	120	100		
University	49	77.8	14	22.2	63	100		
Total	186	82.7	39	11.3	225	100		

Table 4 is unnecessary.

The discussion and conclusion depend on the analysis of the results that need to be better analyzed.
