Potential competing interests: No potential competing interests to declare.

This article researches the literature in the Science Direct database from 2015-2019 to obtain information on research related to the field, including the number of annual publications, international publications, research directions, research subjects, and research methods. The logic of the article is relatively clear. The following are some of my doubts and suggestions about some parts of the article.

Questions.

1. why were the years 2015 to 2019 chosen?
2. what is the basis for the inclusion of 50 articles in the study?
3. what is the reason for removing the data between 2019 and 2022?

Recommendations.

1. abstract section, a brief description of the disability aspect of the technology application is recommended
2. results section.
 - 4.1 It is recommended that statistical charts and graphs be used to represent the literature publication year by year; graphs are not conducive to the reader's visual access to information. Please elaborate on the information referred to at the key points 2015 and 2017. Also, what is the basis for the increase in publications after 2019 can be illustrated with statistical knowledge.
 - 4.2 Information on relevant policies in disability research in the highest and relevant listed countries can be elaborated, i.e. what is the relevance of the national level to disability research as appropriate.
 - 4.3 It is possible to elaborate on the detailed branches of research for each research subject
 - 4.4 The breakdown of each research focus can be elaborated. For example, what aspects of quality of life are being improved?
 - 4.5 Information about intellectual disability can be specified as appropriate.
