The paper gives a good overview depicting the challenges and techniques in the case of VSP of mandibular reconstructions. These basic principles are described on the occasion of a single case. An evaluation and proof of the techniques used are not given yet. Further studies would be needed to evaluate the specified approaches.

For that, a huge number of diversified cases would be needed. A prospective evaluation should help to prove the evidence of the techniques used. A diversification of the cases with respect to the localisation and extension of the defect would be needed.

A comparison of the preoperative findings in correlation with the postoperative results could help to evaluate the GPL method.
