Potential competing interests: No potential competing interests to declare.

Overall, the data presented appear to be robust and well-suited to the study's objectives. The combination of quantitative measures with qualitative rankings provides a comprehensive view of walking behavior and environmental perceptions in a tropical urban setting. The statistical analyses (including regression models and tests for normality and homoscedasticity) suggest a rigorous approach to data analysis.

The presentation of data in tables and figures (particularly Figure 3 and Figure 4) enhances the paper's clarity and supports its conclusions. However, more detailed information on data collection procedures and any data cleaning or preprocessing steps would further strengthen the methodology section.
