Potential competing interests: No potential competing interests to declare.

Current study used the same NYTS data to compare its results to the original study that published in DAD. Current study focused on the potential information bias ("assign "don't knows" to "other brands") that might happen in previous DAD study given how they classify "don't know" response. Using the same dataset, two independent investigators provided two different results and how to treat a “don't know " response might be a difficult topic for future cross-sectional studies and surveys.
