Potential competing interests: No potential competing interests to declare.

First of all, I would like to congratulate the researchers for revealing the current state of play on the biggest global threat of our time. The research is very comprehensive. As a suggestion, the underlying causes of this denial mechanism could have been explored. Individuals who deny climate change could have been contacted and interviewed via social media or another platform and asked to explain exactly what they do not believe and why. Demographic variables of these individuals could be analyzed, including occupation, literacy status, etc. A cross-cultural study could have been conducted by expanding this scope. Perhaps it is their beliefs or traditions that underlie the attitude of climate change deniers. We could find out. But above all these suggestions, this is a very timely and important study.
