Thank you for providing me with the opportunity. I would like to bring attention to a few points. The title could be more assertive. The introduction section requires more clarity in terms of providing background information and stating the aim of this review article. It is important to incorporate the time period during which the review was conducted. Figure 2 provides a basic approach algorithm, but it should address diagnostic criteria and probable COVID cases. It would also be helpful to explain the basis or source attribution for Figure 3. Additionally, it would be beneficial to briefly describe the current state of COVID diagnosis methods such as PCR, CXR, and CT before focusing on changes in interventional radiology during and after COVID. The role of artificial intelligence in interventional radiology during and after the COVID pandemic should be mentioned. Overall, the article is well-written, but it requires a consistent writing style and a few grammatical corrections.
