Review of: "Reconsidering the Role of Exercise in Incretin Pharmacology: How Physical Activity Might Modulate Incretin Degradation and Drug Efficacy"

Camilla Krizhanovskii¹

1. Department of Clinical Science and Education, Karolinska Institute Stockholm, Sweden

This commentary brings up a valid point and an important, novel aspect in trying to work towards precision medicine. It is scientifically sound and very relevant to further investigate the possible role of physical activity in incretin pharmacokinetics.
