

Review of: "Building Foods Data Automation Platform Using Cloud Computing Type PaaS"

Dan Luo

Potential competing interests: No potential competing interests to declare.

The main idea of this paper is to present the use of Cloud Computing Type PaaS to build a food data automation platform. The problem itself is interesting and worthy of research. What is valuable is that the paper is based on a real use case for research and application. However, I find it unfortunate that the paper is not yet at a level to be published as a journal paper.

Specific comments are given below:

1. The narrative style of the paper makes it difficult for the reader to clearly understand the logic and lineage of the author's research. To improve this, I recommend changing the narrative style to one that distills a real-world problem based on existing research and a use case, proposes a solution, and demonstrates the superiority of your solution. This approach will make the paper more logical and easier to follow.
2. It is obvious that the paper lacks an adequate literature review. To clarify the innovation of this paper, it is necessary to supplement a review of research and applications. This will help locate a clear position for your research. It is only in this way that the significance and value of this research can be explained.
3. Section 2, Methods, should be revised to make it easier to find the core methodology of the paper. This will help readers better understand the research and its findings. The author should provide a clear description of how the traditional methods were customized and applied to the real case, rather than presenting each method in a generic way. Describe the challenges you have overcome and the modifications you have made to the methods.
4. The abstract fails to clearly explain the paper's innovation and main research content. As a result, readers cannot quickly understand the main contribution of the paper from the abstract.
5. The first paragraph of the Introduction contains a sentence that is repeated. "Through digitalization strategies and food production innovation, stability and resilience of the country can be achieved."
6. The first sentence at the beginning of the third paragraph of the Introduction is not in English but in Indonesian. This paper has this problem in more than one place, for example, in Table 2 where the Indonesian language appears again. The author should carefully check the language presentation of the whole paper.
7. Finally, I strongly advise the author to reorganize and rewrite this paper with reference to papers in high-quality journals.
