Potential competing interests: No potential competing interests to declare.

I've checked the overall of this study and I noticed a few changes had been made. These are my comments; please consider them constructive criticism to improve the quality of this manuscript.

1. The abstract has improved and is now concise and clear. It also outlines the points that need to be addressed in an abstract, which include brief background, focus/aim, method, and brief findings of the study. These points add more significance to the study.
2. Limitations have been stated well. However, the authors should also recommend that future researchers who are interested in investigating further be more specific on the impacts of oxidative stress in infertility, particularly in women. Authors may list the impacts needed to be focused on, such as the change in hormonal regulation, or others.
3. The citations need to be revised; there are still some citations whose years are italicized and the names underlined. I suggest doing another stage of proofreading and grammatical checking to fix this inconsistency. Also, the writing of '*Moringa oleifera*' needs to be fixed in several parts of the article to reduce inconsistency.
4. In Methodology Group 3, you used the word 'Thirty' rather than a numeral. I suggest sticking with the numeral.

Regarding the concern I mentioned in the previous comment, I appreciate the author for addressing the limit. This acts as an informative reference for future studies.

Lastly, this manuscript is eligible for publication with minor revisions. Please also consider the other reviewers' comments to further improve the quality of this manuscript.
