Potential competing interests: No potential competing interests to declare.

Reviewing "Climate Change, Health, Ethics and the Sustainability of Civilization," the author delves into the precarious state of our planet. They highlight the interplay of factors such as population growth and deforestation, which contribute to climate change, resulting in dire consequences like famine and catastrophic weather events, including tropical cyclones, extreme rainfall, and heat waves. These phenomena pose a significant threat to human civilization. The author astutely warns of the imminent danger to humanity posed by the escalating frequency and intensity of these weather events, leading to higher mortality rates. Whereas the "NUCLEAR WAR" in the modern world is unpredictable, or with the growing innovative technology, "NUCLEAR WAR" may be just a tip of the iceberg.

In the conclusion, the author could further articulate their personal perspective on the matter, providing insight into potential pathways forward. Additionally, offering suggestions to policymakers on implementing technology-driven solutions for sustainable living conditions would enhance the practical relevance of the work. For instance, advocating for the adoption of innovations like urban photo-bioreactors (liquid3.rs) could significantly contribute to mitigating environmental degradation.

Moreover, the author could extend their discourse by providing guidance to young scientists on engaging with multidisciplinary topics. Encouraging research and development in areas intersecting technology, sustainability, and ethics could foster innovative solutions to address the challenges we face.

Overall, the author presents a compelling argument for urgent action to safeguard the future of our civilization.
