Thank you for your work. This report is very interesting and may have enlightening implications for clinical treatment, but I don't think the manuscript can be published because it has many limitations:

1. The description in the abstract section is vague, and the framework is not clear, such as "Initial results demonstrated the restoration of vital functions and the absence of cellular activity."
2. "The safety profile of glucosodiene has undergone scrutiny, revealing favorable characteristics for therapeutic application." Needs literature support.
3. The data of the entire treatment process of the case needs to be comprehensively compared, whether it is imaging examination, pathology, or laboratory testing.
4. The first dose of glucose given to the patient was not provided, and including this information is crucial for a comprehensive understanding of the treatment plan.
5. The conclusion is very short; please at least improve the research objectives, significance, and limitations.
