Potential competing interests: No potential competing interests to declare.

This paper explores the impact of the uncertainty of low-carbon environment on the dual carbon emission reduction target. The research is meaningful. However, in order to further improve the quality of the article, I think the following amendments are needed.

1. In the manuscript, the author explores the impact of the uncertainty of low-carbon environment on total carbon emissions. Total carbon emissions and carbon emission reduction targets are different, and the author should further clarify the research object.
2. The uncertainty of low-carbon environment should be a kind of uncertainty, and the measurement of it in this paper is based on some certain indicators, such as the intensity of regional environmental regulations, so how does this paper reflects the uncertainty?
3. Robustness test is too simple.
4. Abstract is the most important part of a paper, so that readers can understand the article more quickly. The abstract of this paper needs to point out the research problems more clearly.
5. The conclusions and policy recommendations can be separately subtitled for easier reading.
