Potential competing interests: No potential competing interests to declare.

The article examines an interesting, relevant, suggestive and current subject. However, the analysis of the subject is carried out from a descriptive or exploratory perspective that could introduced suggestive aspects about the social consequences of technology in society, especially from a critical vision in which perverse elements are addressed. That may project current technology in the future. In this sense, the historical review of the first part of the article could be connected with the technology that we currently foresee and that is beginning to gain presence in our society, demonstrating a critical or dystopian perspective. In this way, posthumanism (and transhumanism), the possibility that algorithms interaction would simulate humans or the virtual spaces that could be inhabited replacing physical spaces, that is, the Metaverse, could have more presence, as they currently only appear at the end of the article, particularly in the conclusions.
