Juvenile Hyaline Fibromatosis

National Cancer Institute

Source

National Cancer Institute. *Juvenile Hyaline Fibromatosis*. NCI Thesaurus. Code C98297.

A non-neoplastic connective and soft tissue disorder that usually affects infants. It is characterized by the deposition of extracellular hyaline material in the skin, soft tissues and bones. This results in the development of tumor-like masses. Surgical excision is the treatment of choice, however, local recurrences are common.
