Potential competing interests: No potential competing interests to declare.

Dear authors, great article, quite interesting to read.

I have a few suggestions:

- 1. After you guys have done initial calibration and testing, can you please add the results post these modifications? This would be helpful to compare the results.
- 2. Also, can we please have a comparison between the simulated results and the real results? This would be helpful to check what the difficulties, if any, would be in implementing this solution.
- 3. This is more of a question in Figure 10. It is mentioned. The 3-D model of the 5 kg quadcopter, but in the conclusion, the first line is The modeling of a 7 kg quadcopter has been discussed. I'm a bit confused that if we have a 7kg UAV or a 5kg one.

Rest seems good to me. Once again, congrats on this article.
